

LAMPIRE's Preventative Response Measures:
Avian Influenza

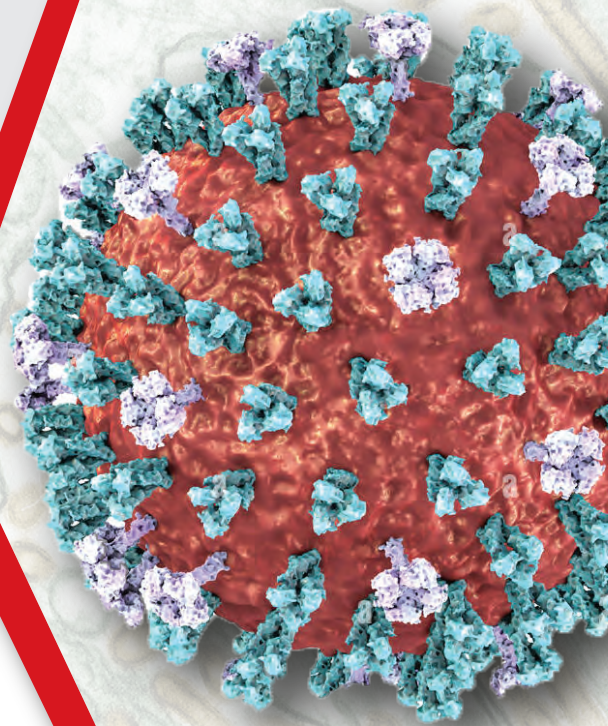

LAMPIRE's Preventative Response Measures:

Avian Influenza

Due to the worldwide focus and attention on avian influenza, also known as "bird flu", we would like to assure you of LAMPIRE's current preventative bird health programs and activities.

These programs and activities include: strict biosecurity measures, transmissible disease surveillance, strategic geographically distinct locations of birds, and emergency disease preparedness. We maintain facilities over 200 miles apart, with avian species at both facilities, to help mitigate catastrophic events.

Biosecurity is a major priority for our company. We maintain the strictest biosecurity measures to prevent the introduction of transmissible poultry diseases, including Avian Influenza, into our production facilities. These measures incorporate dynamic training of all company employees, physical isolation of farms, specially designed poultry housing, and entry guidelines.
